(a) the same 20 wave fields, two return models
below the diagonal, i.e. more accurate with unweighted returns
our arm 15/20 comparator 20/20
beats its own zero field (uniform → slope)
our arm 18/20 → 20/20 comparator 20/20 → 20/20
nRMSE, unweighted returns (slope)
nRMSE, geometry-weighted returns (uniform)
zero field (unchanged)
comparator (LETKF)
our arm
(b) the win count moves by 1; the episodes do not
16/20 won
p = 0.0059
17/20 won
p = 0.0013
per-episode relative difference, our arm vs. comparator [%]
comparator is better above this line
median -28.9%
median -42.6%
uniform (geometry-weighted)
slope (unweighted)
median incidence angle of returned points: 75.37° → 77.63°
