(a) every comparison this paper rests on
against an external baseline
ablations of the representation itself
where the gain sits
B-1 strongest eligible baseline (62/64)
B-12 non-linear ref., fresh seeds (43/48)
B-15 physically correct sensor (17/20)
B-26 sea state of the records (24/24)
B-16 ablate wavenumber continuity (46/48)
B-19 the same, sparse stratum (14/16)
B-22 ablate the learned prior (45/48)
S-ENS ensemble, crowded (55/64)
S-ENS the same, sparse (35/64)
M-10 inside the observed band (45/48)
T-4 at forecast lead (47/48)
our arm vs. its comparator
comparator vs. a zero field
0.2 0.3 0.4 0.5 0.6 0.7 0.8 0.9 1.0
fraction of episodes won (95% Clopper-Pearson)
(b) why the growing margin is not a gain
fraction beating a zero field
1.0 0.9 0.8 0.7 0.6 0.5 0.4
our arm
comparator
0.00 0.25 0.50 0.75 1.00
forecast lead (T_p)
our own absolute error worsens across this range
